

## Amendments to the Claims

### LISTING OF CLAIMS

Claims 1-75 (canceled)

76. (currently amended) A method for fabricating semiconductor components comprising:

providing a plurality of semiconductor dice on a substrate having a first side, a second side and a thickness, the dice comprising a plurality of die contacts;

forming a plurality of polymer filled trenches on the first side between the dice having a depth less than the thickness;

forming a plurality of conductive vias in the dice in electrical communication with the die contacts;

thinning the substrate from the second side to ~~expose~~ the polymer filled trenches;

forming a plurality of grooves through the polymer filled trenches to singulate the dice; and

forming a plurality of terminal contacts on the dice in electrical communication with the conductive vias.

~~die contacts.~~

77. (currently amended) The method of claim 76 ~~further comprising wherein the forming the terminal contacts step comprises~~ etching the substrate following the thinning step to expose portions of the conductive vias.  
~~to form the terminal contacts.~~

78. (currently amended) The method of claim 76 further comprising ~~etching the substrate following the thinning step to expose~~ exposing tip portions of the conductive vias ~~forming a plurality of terminal contacts on the die in electrical communication with the tip portions~~ and forming the terminal contacts on the tip portions.

79. (original) The method of claim 76 wherein the forming the conductive vias step comprising laser machining openings in the substrate, and at least partially filling the openings with a conductive material.

80. (original) The method of claim 76 wherein the forming the conductive vias step comprises implanting a dopant on portions of the substrate and forming the conductive vias on the portions.

81. (original) The method of claim 76 further comprising forming a first polymer layer on the first side, and a plurality of first contact bumps in the first polymer layer in electrical communication with the conductive vias.

82. (currently amended) The method of claim 76 further comprising forming a second polymer layer on the second side, and a plurality of contact bumps in the second polymer layer in electrical communication with the conductive vias, and then forming the terminal contacts on the contact bumps.

83. (original) The method of claim 76 wherein the thinning the substrate step is performed by planarizing the substrate.

84. (original) The method of claim 76 wherein the thinning the substrate step is performed by planarizing and then etching the substrate.

85. (original) The method of claim 76 wherein the thinning the substrate step is performed by etching the substrate.

86. (original) The method of claim 76 wherein the forming the grooves step is performed by sawing through the polymer filled trenches.

87. (original) The method of claim 76 wherein the forming the grooves step is performed by etching through the polymer filled trenches.

88. (currently amended) The method of claim 76 wherein the forming the polymer filled trenches is performed by scribing the substrate with a plurality of trenches and then filling the trenches with a polymer material.

89. (currently amended) The method of claim 76 wherein the forming the polymer filled trenches is performed by etching the substrate with a plurality of trenches and then filling the trenches with a polymer material.

90. (original) A method for fabricating semiconductor components comprising:

providing a plurality of semiconductor dice on a substrate having a first side, a second side and a thickness, the dice comprising a plurality of die contacts;

forming a plurality of conductive vias in the dice in electrical communication with the die contacts; and

etching the substrate to expose portions of the conductive vias.

91. (original) The method of claim 90 further comprising forming polymer filled trenches in the substrate then thinning the substrate from the second side prior to the etching step to expose the polymer filled trenches;

forming a plurality of grooves through the polymer filled trenches to singulate the dice; and

forming a plurality of terminal contacts on the dice in electrical communication with the die contacts.

92. (original) The method of claim 90 wherein the exposed portions of the conductive vias comprise pins.

93. (original) The method of claim 90 wherein the exposed portions of the conductive vias comprise pins in a pin grid array or a micro pin grid array.

94. (original) The method of claim 90 further comprising forming a plurality of conductors on the second side in electrical communication with the exposed portions and a plurality of terminal contacts on the second side in electrical communication with the conductors.

95. (original) The method of claim 94 wherein the terminal contacts comprise balls or bumps in a ball grid array.

96. (original) The method of claim 94 wherein following the etching step the substrate has a second thickness of from 10  $\mu\text{m}$  to 250 $\mu\text{m}$ .

97. (original) A method for fabricating semiconductor components comprising:

providing a semiconductor substrate comprising a plurality of semiconductor dice having a plurality of die contacts, the substrate having a first side, a second side and a thickness;

forming a plurality of trenches on the first side along peripheral edges of the dice, each trench having a depth less than the thickness;

forming a plurality of contact bumps on the die contacts;

forming a plurality of conductive vias in the substrate in electrical communication with the contact bumps;

forming a first polymer layer on the contact bumps and in the trenches to form polymer filled trenches;

thinning the substrate from the second side to expose the polymer filled trenches; and

singulating the dice through the trenches such that each component includes a semiconductor die covered on at least five sides by a portion of the first polymer layer, and portions of the polymer filled trenches.

98. (original) The method of claim 97 further comprising forming a second polymer layer on the second side, and forming a plurality of terminal contacts on the second polymer layer in electrical communication with the conductive vias.

99. (original) The method of claim 97 further comprising etching the substrate following the thinning step such that the substrate is recessed with respect to the portions of the polymer filled trenches.

100. (original) The method of claim 97 further comprising etching the substrate following the thinning step to form the conductive vias as pins in a pin grid array or micro pin grid array.

101. (original) The method of claim 97 further comprising etching or grinding the portions of the polymer filled trenches such that the portions are recessed with respect to the substrate.

102. (original) The method of claim 97 further comprising forming a plurality of second contact bumps in the second polymer layer in electrical communication with

the conductive vias and then forming the terminal contacts on the second contact bumps.

103. (original) The method of claim 97 wherein the conductive vias comprise openings in the substrate, insulating layers on the openings and a conductive material in the openings.

104. (original) The method of claim 97 wherein the conductive vias comprise portions of the substrate implanted with a dopant.

105. (original) A method for fabricating semiconductor components comprising:

- providing a plurality of semiconductor dice on a semiconductor substrate having a circuit side and a back side;

- forming a plurality of trenches along peripheral edges of the dice part way through the substrate;

- depositing a polymer material in the trenches;

- forming a plurality of contact bumps on the dice;

- forming a first polymer layer on the circuit side and the contact bumps;

- forming a plurality of conductive vias in the dice in electrical communication with the contact bumps;

- thinning the substrate from the back side to contact the polymer material in the trenches and to thin the back side;

- forming a plurality of terminal contacts on the back side or on the circuit side in electrical communication with the conductive vias; and

- singulating the dice by forming grooves through the trenches and the polymer material.

106. (original) The method of claim 105 further comprising forming a second polymer layer on the back side

and forming a plurality of second conductive vias in the second polymer layer in electrical communication with the conductive vias.

107. (original) The method of claim 105 further comprising forming a plurality of second contact bumps on the back side following the thinning step in electrical communication with the conductive vias, and forming the terminal contacts on the contact bumps.

108. (original) The method of claim 105 wherein the forming the conductive vias step comprises laser machining openings and at least partially filling the openings with a conductive material.

109. (original) The method of claim 105 wherein the forming the conductive vias step comprises implanting a dopant into a selected portion of the substrate.

110. (original) The method of claim 105 wherein the thinning the substrate step comprises mechanically planarizing the substrate.

111. (original) The method of claim 105 wherein the contact bumps and the first polymer layer have a planarized surface.

112. (original) The method of claim 105 wherein the thinning the substrate step comprises mechanically planarizing then etching the substrate.

113. (original) The method of claim 105 wherein the thinning the substrate step comprises etching the substrate.

Claims 114-260 (canceled)
